DETAILED ACTION

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.
- 2. Claims 1, 5-7, 9-15, 19-20, 23, 26, and 33-34 are rejected under 35 U.S.C. 102(e) as being anticipated by Wieland et al. US 6,413,449.

Regarding claim 1, Wieland '449 discloses a catalyst comprising palladium/zinc and zinc oxide deposited on a metal oxide (see abstract), wherein the catalyst has a hydrogen productivity of more than 20, and up to 60, Nm³/kg_{cat}•h (see column 5, lines8-15).

Regarding claims 5 and 6, Wieland '449 discloses dispersing support and zinc oxide, adding acidic palladium, and adding a base (see column 7, lines 5-13), followed by redispersion and coating with the catalyst material (see column 7, lines 22-24),

Art Unit: 1754

wherein palladium and zinc that has passed into solution are precipitated together (see column 7, lines 37-40).

Regarding claim 7, Wieland '449 discloses oxide of aluminum, titanium, and zirconium (see abstract).

Regarding claim 9, Wieland '449 discloses palladium and zinc that has passed into solution are precipitated together (see column 7, lines 37-40).

Regarding claim 10, Wieland '449 discloses immersion in a solution of only zinc nitrate (see column 10, lines 58-59).

Regarding claim 11, Wieland '449 discloses 768.5 g zinc nitrate in one liter of water, which is about 1M zinc.

Regarding claim 12, Wieland '449 discloses dispersing support and zinc oxide, adding acidic palladium, and adding a base (see column 7, lines 5-13), followed by redispersion and coating with the catalyst material (see column 7, lines 22-24).

Regarding claim 13, Wieland '449 discloses neutralizing the acid solution, which would require at least a neutral pH of 7 (see column 7, lines 11-12).

Regarding claim 14, Wieland '449 discloses calcining at 300-550 degrees C (see column 7, lines 25-28).

Regarding claims 15 and 33-34, Wieland '449 discloses depositing Pd as a solution (see Examples) and calcining at 300-

Art Unit: 1754

550 degrees C (see column 7, lines 25-28), which overlaps Applicant's claimed range with sufficient specificity.

Regarding claims 19-20 and 26, Wieland discloses more than 20, and up to 60, Nm^3/kg_{cat} (see column 5, lines8-15), which would inherently be characterizable in different units of measurement.

Regarding claim 23 arranging on a surface shell about 250 microns thick (see Example 2).

Claim Rejections - 35 USC § 103

- 3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 4. Claims 8, 17-18, 21, 31-32 rejected under 35 U.S.C. 103(a) as being unpatentable over Wieland '449.

Wieland fails to disclose large pores.

It is considered that it would have been obvious to one of ordinary skill in the art at the time the invention was made to use large pores in the support of Wieland because Wieland discloses pore volume impregnation (see Examples) and a specific

Art Unit: 1754

surface area of 140 square meters per gram (see column 8, line 22), which would obviously, to one of ordinary skill, suggest large pores in order to achieve the discloses surface area.

Regarding claims 17-18 and 21, Wieland discloses 82.6% alumina and 11.6% ZnO.

Wieland fails to disclose 1-15% Pd.

It is considered that it would have been obvious to one of ordinary skill in the art at the time the invention was made to use 1-15% Pd because Wieland discloses 5.8% PdZn alloy, which would obviously, to one of ordinary skill, at least suggest an alloy thereof causing between 2% and 5% Pd to be present.

Regarding claim 31, Wieland fails to disclose the Pd depositing subsequent to the drying step.

It is considered that it would have been obvious to one of ordinary skill in the art at the time the invention was made to deposit the Pd after drying because Wieland specifically discloses that it is known to preliminarily coat the support with a pretreatment of zinc followed by drying (see column 3, lines 26-31), which would obviously, to one of ordinary skill, suggest pre-coating with zinc, drying, then depositing Pd.

Regarding claim 32, Wieland '449 discloses calcining at 300-550 degrees C (see column 7, lines 25-28), which overlaps Applicant's claimed range.

Art Unit: 1754

5. Claims 16 and 22 are rejected under 35 U.S.C. 103(a) as being unpatentable over Wieland '449 as applied to claims 15 and 21 above, and further in view of Feinstein et al. US 4,177,219.

Regarding claims 16 and 22, Wieland fails to disclose Ru.

Feinstein discloses 0.5% Ru (see Table III and claims 3 and 6).

It is considered that it would have been obvious to one of ordinary skill in the art at the time the invention was made to use the 0.5% Ru of Feinstein in the reforming catalyst of Wieland because Feinstein discloses his 0.5% Ru in a reforming catalyst (abstract, summary) for high scission activity of catalysts (see column 8, lines 20-22) and effective conversion and selectivity (see column 9, lines 35-43).

Allowable Subject Matter

- 6. Claims 24-25 is objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.
- 7. The following is a statement of reasons for the indication of allowable subject matter: A metal oxide layer of a thickness less than 40 microns and the large pore support is foam or felt in the catalyst of the instant claim 24 would not have been obvious to one of ordinary skill in the art at the time the

Art Unit: 1754

invention was made. 50% of the catalyst's pore volume being composed of pores in the size range of 0.3 to 200 microns in the catalyst of the instant claims 25 also would not have been obvious to one of ordinary skill in the art at the time the invention was made.

Response to Arguments

8. Applicant's arguments filed 6/18/04 have been fully considered but they are not persuasive.

It is argued that Applicants have discussed and distinguished this reference... the application. This is not persuasive because Applicant's assertion regarding the productivity of the catalyst appears to be based on mere assumptions (the density and conversion) and process of using distinctions, rather than actual product differences.

It is argued that claim 5 recites that the Pd is deposited after... increase pH. This is not persuasive because Wieland discloses discloses dispersing support and zinc oxide, adding acidic palladium, and adding a base (see column 7, lines 5-13), followed by redispersion and coating with the catalyst material (see column 7, lines 22-24), which anticipates the instant claim 5. And, in any case, the claimed steps do not explicitly set forth that the steps are limited to in order according to each previous step. It is noted that the features upon which

Art Unit: 1754

applicant relies (i.e., steps requiring a specific order) are not recited in the rejected claim(s). Although the claims are interpreted in light of the specification, limitations from the specification are not read into the claims. See *In re Van Geuns*, 988 F.2d 1181, 26 USPQ2d 1057 (Fed. Cir. 1993).

It is argued that the method of claim 5 is further patentable over Wieland... comprising dissolved zinc. This is not persuasive because Wieland discloses immersing the support in a solution containing zinc (see Example 1).

It is argued that the dependent claims... recited therein. This is not persuasive because the zinc solution is not discloses as partially dissolved and would inherently be completely dissolved, since it is a zinc solution. Applicant refers to partially dissolved zinc oxide powder. However, Example 1 discloses a solution of zinc nitrate, which anticipates the claimed completely dissolved zinc.

It is argued that claims 16 and 22 are additionally patentable because ... Wieland and Feinstein. This is not persuasive because Applicant appears to merely point out that the references are different, which by itself is not a showing of insufficient motivation. The examiner recognizes that obviousness can only be established by combining or modifying the teachings of the prior art to produce the claimed invention

Art Unit: 1754

where there is some teaching, suggestion, or motivation to do so found either in the references themselves or in the knowledge generally available to one of ordinary skill in the art. See In re Fine, 837 F.2d 1071, 5 USPQ2d 1596 (Fed. Cir. 1988) and In re Jones, 958 F.2d 347, 21 USPQ2d 1941 (Fed. Cir. 1992). In this case, it is considered that it would have been obvious to one of ordinary skill in the art at the time the invention was made to use the 0.5% Ru of Feinstein in the reforming catalyst of Wieland because Feinstein discloses his 0.5% Ru in a reforming catalyst (abstract, summary) for high scission activity of catalysts (see column 8, lines 20-22) and effective conversion and selectivity (see column 9, lines 35-43).

Conclusion

9. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, THIS ACTION IS MADE FINAL. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened

Art Unit: 1754

statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

10. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Edward M. Johnson whose telephone number is 571-272-1352. The examiner can normally be reached on M-F 9:30-6:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Stanley S. Silverman can be reached on 571-272-1358. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
